

DAX Functions Used in This Project

Below is the complete DAX code used to generate the custom Date Table. The implementation includes date extraction, formatting, and string manipulation functions to enhance the Date Dimension for analytical reporting.

- 1) date table = **CALENDAR**(**DATE**(2022,01,01),**DATE**(2025,01,01)) → Creates a continuous date table from 01-01-2022 to 01-01-2025 with one row per day.
- 2) week day = **WEEKDAY**('date table'[Date].[Date],2) → Returns the day number of the week where Monday = 1 and Sunday = 7 (because of argument 2).
- 3) week num = **WEEKNUM**('date table'[Date].[Date],11) → Returns the week number of the year based on system type 11 (week starts Monday).
- 4) month short name = **FORMAT**('date table'[Date].[Date],"MMM") → Converts the date into short month name (e.g., Jan, Feb).
- 5) month = **FORMAT**('date table'[Date].[Month],11) → Converts the date/month value into a formatted text representation.
- 6) week full name = **FORMAT**('date table'[Date].[Date],"DDDD") → Returns the full weekday name (e.g., Monday).
- 7) week short name = **FORMAT**('date table'[Date].[Date],"DDD") → Returns the short weekday name (e.g., Mon).
- 8) month num = **MONTH**('date table'[Date].[Date]) → Extracts the numeric month from the date (1–12).
- 9) concat 1 = **CONCATENATE**('date table'[week short name],'date table'[month short name]) → Combines week short name and month short name into one text string.
- 10) concat 2 = **CONCATENATE**(**CONCATENATE**('date table'[week short name]," - "),'date table'[month short name]) → Combines week short name and month short name separated by " - ".
- 11) left fun = **LEFT**('date table'[concat 1],3) → Extracts the first 3 characters from the concatenated text.
- 12) right fun = **RIGHT**('date table'[concat 1],3) → Extracts the last 3 characters from the concatenated text.
- 13) mid fun = **MID**('date table'[week full name],2,2) → Extracts 2 characters starting from position 2 in the full weekday name.
